AI defined

Three trends have put advanced analytics/ AI within everyone's reach...

AI encompasses a spectrum approaches

Illustrative

Traditional Al	
Machine Learning	
	\
Deep Learning	
Generative Al	

		Definition	Advantages	Example use cases
1	Traditional Al	Rules-based systems that mimic human cognitive functions	Interpretable, can make decisions based on explicit rules	Engineering design optimization
2	Machine Learning	Algorithms that can analyze and learn from data	Can learn and improve performance over time, can handle large data sets	Manufacturing defect detection
3	Deep Learning	A subset of ML algorithms that use neural networks with multiple layers (3+)		Computer vision in factories
4	Generative Al	Group of ML/DL algorithms that generate outputs based on data they have been trained on	Can generate new and original content	Software development augmentation / co-pilot Regulatory filing draft creation

Similar to how the human brain works, AI receives information, learns from it, improves its model and makes better decisions over time

Decide

Machines do tasks or make decisions based on the output of algorithms and their predictions

Machines identify patterns and make decisions similar to how humans when faced with something new, compare it to a known pattern to make sense of it before acting

Receive information

Machines do tasks or make decisions based on the output of algorithms and their predictions

Machines continue to receive new data, structured and unstructured, similar to how humans build experience as they grow

Learn

Machines process the data through algorithms changing them as they learn more about the information they are processing

Algorithms performance improves as they are exposed to more data over time

And then ... Generative AI

Non-exhaustive

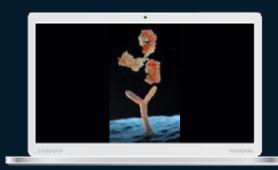

Generative AI (GenAI) enables the creation of new unstructured content, such as text, images, etc.

GenAl is powered by Foundation Models (artificial intelligence models) trained on a **broad set of data** that can be adapted to a wide range of tasks

These models are typically also **better** at interpreting / labelling unstructured data than traditional Al

Generate marketing or social media copy in "house style" using ChatGPT, Copy.A, etc.

Accelerate the drug discovery process, reducing time in laboratories with ABSCI, etc.

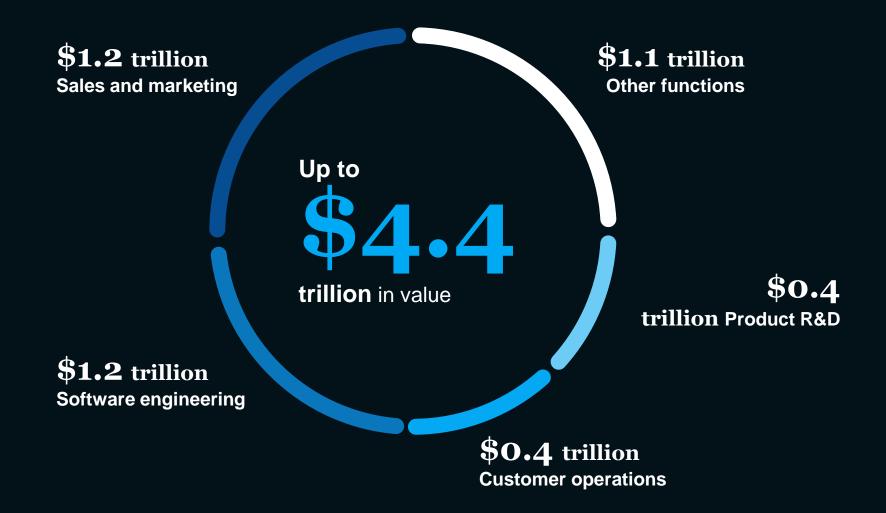

Create new product design concepts using DALL-E2, Stable Diffusion, etc.

Automate code generation in programming languages like Python with Codex/Github Copilot, etc.

Generative AI is poised to boost performance and unlock trillions of dollars across functions

Four main GenAI use case archetypes ("4 C's") are demonstrating significant value in industry

Explored next

Content Synthesis (insight generation AI)

ChatGPT able to act as a virtual assistant

AutoGPT Self-prompting ChatGPT for executing complex tasks

RPA for business processes

~14%

Productivity increase for customer support agents using Al assistants¹

Coding & Modelling (content generation AI)

GitHub Copilot GitHub's co-pilot for coding

Cody

Google's co-pilot for coding

MOSTLY-AI

Synthetic data for machine learning models

>55%

Productivity gains for developers utilizing coding copilots such as Github Copilot²

Creative Generation (content generation AI)

Jasper

Copywriter and content generator

Artificial image generator

IIElevenLabs

Artificial voice generator

Expected increase in AI generated outbound marketing messages by 2025³

Customer Engagement (interaction AI)

Dialogflow Google's chatbot service

ChotSoot Hubspot's CRM chat service

yellow.ai

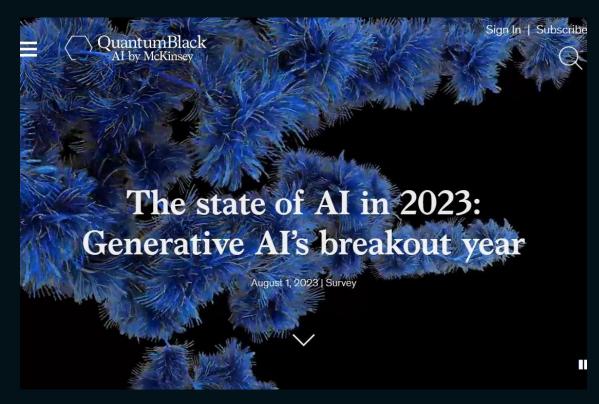

Conversational CX service

>60%

Al-driven automation potential of customer interaction volumes over next 5-10 years⁴

- Stanford and MIT study, Generative AI at Work, NBER, Apr 2023
- GitHub, Research: quantifying GitHub Copilot's impact on developer productivity and happiness, Sep 2022
- Gartner, Beyond ChatGPT: The Future of Generative AI for Enterprises, Jan 2023 increase from 2% in 2022 to 30% in 2025
- McKinsey analysis on automation potential in CX BPO, 2023 today 20-30% of volume is automated

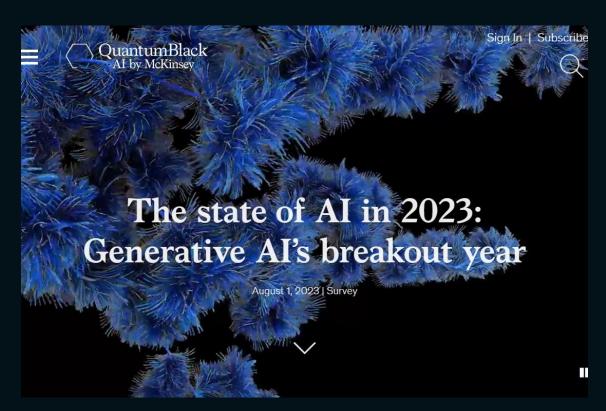

About the Research

The State of AI in 2023

The online survey was in the field April 11 to 21, 2023, and garnered responses from 1,684 participants representing the full range of regions, industries, company sizes, functional specialties, and tenures.

The State of AI in 2023 – Generative AI's Breakout Year

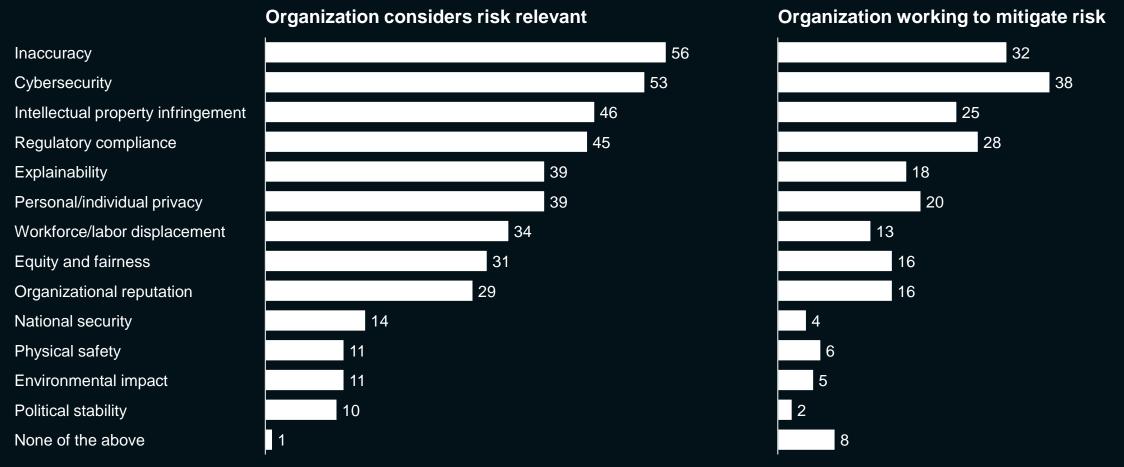

The State of AI in 2023

- 1. It's early days still, but use of gen Al is already widespread
- 2. Leading companies are already ahead with gen Al
- 3. Al-related talent needs shift, and Al's workforce effects are expected to be substantial
- 4. With all eyes on gen Al, Al adoption and impact remain steady

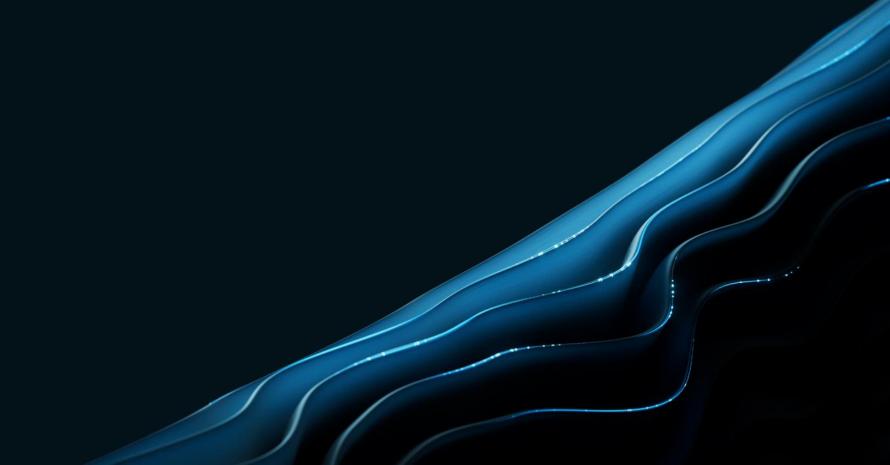

Inaccuracy, cybersecurity and intellectual property infringement are the most-cited risks of generative-AI adoption

Generative Al related risks that organizations consider relevant and are working to mitigate, % of respondents¹

^{1.} Only asked of respondents whose organizations have adopted Al in at least one function. For both risks considered relevant and risks mitigated, n = 913.

Digital trust

What is Trustworthy Artificial Intelligence?

Source: EU Commission High-Level Expert Group on Artificial Intelligence

Trustworthy AI has three components: (1) it should be lawful, ensuring compliance with all applicable laws and regulations (2) it should be ethical, demonstrating respect for, and ensure adherence to, ethical principles and values and (3) it should be robust, both from a technical and social perspective, since, even with good intentions, AI systems can cause unintentional harm.

Digital Trust helps identify, assess, and mitigate risk

Elevated digital and analytical risks

Higher public sensitivity

Upward opportunity

Higher performance

Lower operational costs

Greater acceptance

Downward protection

Decreased likelihood of disruption

Reduced operational risk

Reduced regulatory and reputational risk

In our increasingly digital world, 'trust' is a differentiator for high performers...

Preliminary

Not exhaustive

87%

of customers believe it is important for them to be able to review and control their personal data online¹

71%

of customers factor a company's ability to keep information safe into buying decisions¹ **282**%

Cumulative stock market returns of trusted brands in 2022 compared to 36% for untrusted brands²

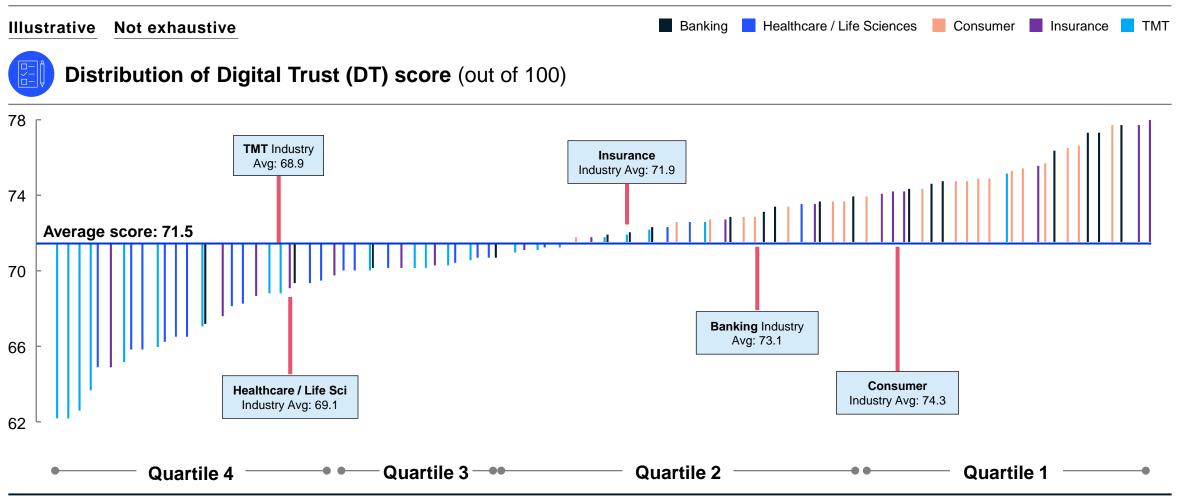

...What is Digital Trust?

Digital Trust is an individual's confidence in an organization to protect their data, enact effective cybersecurity measures, offer trustworthy AI-powered products and services and provide transparency around AI and data usage.

Digital Trust addresses digital and analytic risk across AI/ML & analytics, data, technology & cloud, and risk capabilities & culture

Digital Trust performance of 100 selected companies in Digital Trust Index compared to industry peers and Digital Trust leaders

Full list of measurement indicators in back-up

Source: McKinsey expert analysis McKinsey & Company

^{1.}Digital Trust Emergents are defined as the bottom quintile companies in the Digital Trust Index database 2.Digital Trust Leaders are defined as the top quintile companies in the Digital Trust Index database

Digital trust levers and priorities

Theme	Immediate priorities	Questions for tomorrow
Vision and strategy	Does your organization have a digital trust vision (e.g., what constitutes ethical use of data, tech, and responsible AI)?	Is your vision & mission future-proofed (e.g., trust infrastructure in place to support imminent innovations)?
	How is data and technology ethics being built into strategy? (e.g., repeatable playbooks, governance mechanisms, etc.)	How are you planning talent strategy for the future (e.g., with Gen Al's ability to automate and augment tasks)?
Framework and Taxonomy	Does your organization have a data and privacy risk management function (e.g., common language across the organization, risk taxonomy)?	Does your organization have a mechanism to ensure that the taxonomy is continuously updated?
Policies and Standards	How is your organization's data managed / structured to enable quick and consistent access to insights (e.g., data quality standards, tooling)?	What new and evolving data, Al and technology policies do you need (e.g., policies around managing third-party risks in foundation models)?
Capabilities & controls	How is data being safeguarded, and are the strongest controls being applied to the most critical data? (e.g., Data Leakage Prevention program)	What new capabilities (e.g., hardware, cloud, MLOps) and controls (e.g., privacy enhancing technologies) are needed to enable digital trust long-term?
Adoption and Scaling	What governance & change management practice is in place to address new data use cases?	How do teams keep pace with translating data and Al trust decisions into technical requirements, especially in a rapidly evolving business landscape?

AI/ML in digital impacts existing risks and brings new ones

Increase in existing risks

Extensive data requirements

AI/ML techniques require vast amount of data and management of hundreds of features

Appearance of new risks

Bias and unethical behaviour

AI/ML models can lead to unintended results that cause bad public and regulatory reaction

10101

10101

Algorithmic transparency and complexity

There are a large number of available machine learning algorithms, many of which are complex and opaque

Explainability

Understanding of human-machine interactions and use of explainable AI/ML is still evolving

Exploitation or misuse potential

Al/ML systems have characteristics, such as frequent retraining, scalability and anonymity, that increase risks of misuse

Risk inducing scalability

AI/ML makes it possible to embed analytics deeply into process workflows and automate decisions

Fairness and bias management

Fairness in algorithms

Fairness concerns are becoming increasingly relevant for **models whose decisions directly affect customers** e.g., loan approval models, pre-screening models for hiring, personalized marketing models

While there do not yet exist widely-accepted definitions, metrics and thresholds for fairness risks, managing the risk of unfair model operation is an **important** component of an overall digital ethics strategy

If fairness risks are not monitored and managed appropriately, this may result in **reputational risks for the company**, which may significantly impact revenues.

Fairness risks appear in different ways in each business unit

Human resources & talent Marketing & Sales Customer support **Exemplary business** units Product / service mgmt. & development Strategy & 000 corporate finance Core IT & security

Typical questions

Fairness concerns

How can we choose the best fitting candidate? How can we ensure our hiring processes are fair?

When using algorithmic systems for classification and evaluation, discrimination and selection bias might occur

How can we target different audiences? How can we use data to drive sales conversions?

Users' and customers' willingness to share data may be undermined due to perceptions about the collection and use of data

How can we provide an easy self-registration process?

How can we drive efficiencies through chatbots?

How can we ensure that our services are fair?

When digital interfaces and tools like chatbots are offered, the human-machine interactions might lead to unfair outcomes

When digital products are developed, they might be rejected by users due to ethical concerns, resulting in high innovation and development costs

Which processes need to be digitalized?
How can we adapt our business model in

How can we collect data for future

alignment to fairness factors?

improvements?

When new business models are explored or developed, there can be unintended consequences that discriminate for or against certain populations

How can we ensure our models are fair and secured?

How can we ensure roles and responsibilities are clear?

When new systems are introduced, both employees and management may be affected and disadvantaged. There can be unclear responsibilities

Leadership support is critical to creating a fairness culture and governance structure for risk mitigation and harm avoidance

A Fairness Framework serves as a strategic framework for operationalizing fairness principles in a corporate context thriving for valuecentered innovation

Responsibilities

Organizations starting their AI/ GenAI journey should focus on Responsible AI from day-one

Risk categories to address with Responsible Al

Impaired fairness

Algorithmic bias; misrepresentation of generated content as human-created

Performance & explainability risk

Inability to explain model outputs appropriately and model inaccuracies

IP infringement

Infringement on copyrighted or otherwise legally protected materials

Security threats

Vulnerabilities in generative AI systems that may be breached or exploited

Privacy concerns

Unauthorized use/disclosure of personal or sensitive information

ESG impact

Non-compliance with ESG standards; reputational risk

Malicious use

Al-generated promulgation of malicious content

Third-party risk

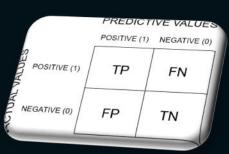

Risks associated with the use of third-party Al tools

Assurance strategies

QuantumBlack, Al by McKinsey

In AI space, MLOps promotes assurance

ML Lifecycle

Data management

Ensure data availability, quality and control to feed the ML system

Data discovery

Data transformation

Data versioning

Development

Standardize processes & tooling to improve team efficiency and solution performance

Production ready code (incl. CI)

Model choice & optimization

Experiment tracking

Deployment

Standardize processes & provision tooling to reliably deploy solutions

Model management & deployment (incl. CD)

Model validation

Serving infrastructure

Live Ops

Maintain reliable model performance and drive continuous improvement

Monitoring

Model maintenance

Continuous improvement

User support

Enablers

Technology Stack

Provision the environment & tooling to optimize ML workflows

Compliance, security & risk

Establishing processes, governance and tooling to control your ML system

Assetization

Assetizing and maximizing reuse of ML components across the ML portfolio

People

Establish tech talent bench & new org/op model to delivery new ways of working
